

RackN

Bare Metal Made Better

Digital Rebar Landscape

At RackN, we believe that managing bare metal infrastructure should be consistent, efficient, and repeatable. Our Digital Rebar platform delivers a powerful solution to prepare your infrastructure for any operating system, hardware vendor, or environment. With a focus on automating and orchestrating workflows, RackN simplifies complex processes to ensure your systems are configured, provisioned, and managed consistently throughout their lifecycle. What we call “node ready.”

With built-in support for core services like DHCP, DNS, IPAM, and secrets management, RackN handles key infrastructure tasks. We integrate smoothly with existing services or provide temporary replacements during setup. This flexibility extends to service orchestrators, DevOps pipelines, and compliance frameworks, enabling a seamless fit into your operations.

The platform abstracts complexity while reducing operational overhead, allowing customers to focus on delivering value, not managing infrastructure. By delivering a complete bare metal platform, we also make upstream installers like Ansible, Chef, and Puppet work more quickly and consistently.
